Bucket Washer.

The Feed-R-Cleaner bucket cleaner can be mounted anywhere on the frame. The reset should be as close to the washer as possible for easy access. We recommend Chlorine Dioxide as a cleaning agent at not more than 100 ppm. If Chlorine Dioxide is used, the reclaimed liquid can be spread on the ground as a sanitizing agent. This cycle also helps to clean and maintain the flow meter assembly. Be sure to set the Feed-R-Meter controller to 1.0 quarts for this operation.

1. Flip the switch on the cleaner circuit to CLEAN.
2. Place a bucket over the Spinner Ball.
3. Hit the reset switch.
4. When the cycle is complete, place a new bucket in its place and hit the reset again. Repeat until all buckets are cleaned.
5. An alarm will sound when the solenoid is engaged and will stay in alarm mode until the FEED switch is activated or until the reset has been toggled. This alarm will warn you that the solenoid is activated and will help alleviate the chance of the solenoid being left on for long periods of time.
